Dashboards in our daily life...

If you ever have a chance to take a look at an antique car, the one thing that might look different is the **car's dashboard**. You might find an RPM gauge that takes up half of the screen or a speedometer that goes all the way up to 300 km/h. While it is virtually impossible to imagine driving your car without a dashboard, as technology advances the one-size-fits-all solution can seem quite out-of-date.

Today's car manufacturers equip the dashboard with various instruments, such as a secondary screen displaying anything from direct access to our favorite radio stations to GPS equipment. Another dashboard in our everyday lives is the one in **our smartphones**. Used, not only for personal purpose but also for work, it is highly more adaptable to our lives. The flexibility of choice for applications to be displayed and notifications sent has become the norm for the user with each application being independent from the other.

Similarly, this flexibility is the basis of our **SILXchange** for the Glass Industry. This solution provides dedicated dashboards for the production and it is adaptable to the different requirements and roles in the plant.

This tool is particularly useful since it allows every user to personalize their own dashboard with useful indicators suitable for their particular needs; from a line operator to a head office manager the options are countless with a comprehensive suite of more than 50 configurable widgets.

Additionally, suitable notification icons have been integrated to **SILXchange** widgets to allow direct access to the information without having to navigate through menus.

SILXchange will be soon available on your smartphone. Come discover it at our stand at Glasstec!
